Electricity/Magnetism Study Guide (use your notes to study as well)

1. What does the Law of Electric Charges say?

Objects that have opposite charges (one positive and one negative) attract one another. There is a force that pulls them together.

Objects that have the <u>same charges</u> (both positive or both negative) <u>repel</u> one another; they push apart from each other.

2. What is electric discharge?

When static electricity charges move off objects.

- 3. What three things are necessary to create a circuit?
- A source of energy, (battery or the energy from the electric company)
 A load (light bulb, television, refrigerator)
- 3. Conductive wires to connect the load and the energy source, and create the circuit
- 4. What is a "load", in an electric circuit?

Any device that is powered by current electricity

5. What is a "filament" in an incandescent light bulb? What is it made of?

The filament is the thin wire that connects the two small posts in a light bulb. It is made of tungsten, which is a semiconductor metal.

This is because rubbing creates a negative charge that is transported from electrons. If you keep two nearby magnets, you would find out that if you try to push the two-pole south (s), together, they reject each other. The strength of ... instead, it is said that an electric current is a flow of «electricity .â» What is the relationship between electricity and magnetism? When the electrons are flowing in a current through a conductor, as a piece of metal or a wire coil, the conductor becomes a temporary magnet, a «magnet» .. no requested credit card, no purchase obligation. You can plan online tutoring lessons at your personal scheduled times, all with a repayment guarantee. We call the North Pole (n) end of the magnet and the other end of the south pole (s). Credit: A, When an object is rubbed against another, static electricity is created. Here A «Iâ» is the current and «Bâ» is the magnetic field. EtutorWorld offers one-to-one Live Tutoring at affordable prices on the Web for Degrees K-12, Prep Help Test for standardized tests such as SCAT, COGAT, MAP, SSAT, SAT, ACT, ISEE and AP. Fill the empty spaces «Electron Static magnetic field electromagnet of B.Ã, real state or fake fake true true false to learn more about electricity and magnetism and other important topics with 7th Grade Science Tutoring, at EtutorWorld. Each electron is surrounded by a force called electric field. The relationship between electricity Magnetism is called electromagnetism. It is known that The charges take two different forms, positive charges and negative charges to negative charges and negative charges to negative charges and negative charges are negative charges. through a conductor, such as a piece of metal or a wire coil, the conductor becomes a temporary magnet, an electromagnet. We also offer the advantage of personalized lesson plans, flexible times and the convenience of learning from home. R. The magnets are very different: atoms at an end have electrons that rotate in one direction, while those within the other ends rotate in the opposite direction. When an electron moves, it creates a second field, a magnetic field. No requested credit card, no purchase obligation. These electrons accumulate to produce static electron metal copper are freely mobile. The electric current flowing through the thread produces produces field. Plan a free session to meet a tutor and get help on any topic you wish! Electricity static A" an electrical phenomenon in which charged particles are transferred from one body to another. Like rejected poles, unlike attracted poles. This fact can be easily described by a small magnet that can hold or suspend an object. The first online tutoring lesson One-On-One A" always free, no purchase obligation, no credit card required. Our expert science tutors take down topics through interactive one-to-one sessions. Plan a free session to meet a tutor and get help on any topic you wish! In most objects, all atoms are in balance with the met electrons rotating in one and a half directions rotating in the other direction. In electricity the particle involved the electron, which carries a charge, as negative. A¢ ⥠|Â" |The study of electric charges at rest. Download Worksheet - Electricity and magnetism No credit card required, no obligation to buy. For example, if two objects are scrubbed together, especially if the objects are insulating and the surrounding air is dry, the objects acquire equal and opposite charges and an attractive force develops between them. The object that loses the electrons is positively accused, and the other becomes negatively charged. The strength of the magnetic field flows from the North Pole¢ to the South Pole.
