How to unlock whirlpool front loader washer door

How does a washing machine door lock work? How do you reset a Whirlpool washing machine? How do you manually unlock a Whirlpool Duet washer? How do you unlock the control lock on a Whirlpool Duet washer? How do you reset a front load washer? Where is the filter on a Whirlpool front load washer? How do I turn off the control lock on my Whirlpool washer? How do I remove the front of my washing machine? Where is the drain filter on a Whirlpool Duet washer? How to Unlock a Whirlpool Duet Washing Machine Reach up inside the front panel and locate the door latch assembly on the right side of door. Feel for a tear-drop shaped tab on the bottom of the door latch assembly. This tab will manually unlock the door. Gently pull down on tab about 1/4 inch or until you hear a click. The door should open. Click to see full answer Hereof, how do you manually unlock a Whirlpool washing machine door?Hold down the "Control Lock" button on your Whirlpool washer for three seconds at the end of the washing cycle. Listen, and when you hear the unlatching sound, the door should open.Secondly, how do you bypass the lock on a front load washer? How to Bypass a Washing Machine Lid Lock Turn off the washer and unplug the appliance. Locate the retaining tabs and/or screws that hold the top horizontal panel down. Look for the lid lock switch on the underside of the top panel and where it fits into the appliance. Put the lid back down and plug the washing machine back into the electrical outlet. Considering this, how do you unlock a Whirlpool front load washer? You can manually unlock the washer by removing the top (remove screws on the back of the top panel and slide the top panel back to lift off, then with the washer unplugged reach down and pull a small ring on the top of the door lock to manually open the door lock.How do I turn off the control lock on my Whirlpool washer?To turn off Control Lock, press and hold the Options key that says "Control Lock Hold 3 Sec" under it for 3 seconds. If the dishwasher has a dedicated Control Lock button in the Options selections, press and hold CONTROL LOCK for 3 seconds (press the words "Control Lock). By Cecilia Harsch Updated December 09, 2018 Your Whirlpool Duet washing machine automatically locks the door as a precaution against opening the door during a wash cycle. If the door did not lock, small hands or preoccupied minds might open the door and allow water to flood the laundry area, or sustain an injury by reaching inside a spinning washtub. The lock remains engaged until the water drains from the tub. Cancelling unintentionally pressed wash cycle options can often unlock the washer, or you can access the manual release ring to unlock the door. Check to see if you accidentally pressed the "Fan Dry" option as part of the wash cycle. Pressing the power button cancels the "Fan Dry" option and unlocks the door. Press the "Drain and Spin" button on the washer's control panel to attempt to unlock the machine. This may drain any excess water that could cause the machine to remain locked. Once the "Drain and Spin" cycle completes, the door should unlock. Check whether the "Add Garment" button is lit. Pressing the start button unlocks the washing machine if you engaged the "Add Garment" feature. Unplug your washer from the wall outlet if none of the these steps unlocks the door. Use a T-20 Torx screwdriver to remove the three Torx-head screws along the bottom front of the washer. Pull down on the bottom panel and pull it away from the washer. Reach through the open panel and up to the door lock. Find the release ring below the locking mechanism. Pull down on the ring to unlock the door. If you must manually unlock the washer door after each wash cycle your drain pump or pressure switch may have failed and would need replacing. There's nothing worse than having a washer door locked and you can't get it open. Regardless if your clothes are inside or not, this can be very frustrating. Do you have a Whirlpool washer that has a locked door and is displaying a flashing light? There are several reasons this may be. There are also different reasons for this problem according to if you have a top loading washer or a front loading washer. Today we will take a look at each washer design and discuss the potential issues and how to fix them. Whirlpool Top Loader With Locked Door If you have a Whirlpool top loader and the door is locked with a flashing light, here are some things you'll need to check: Check the lid switch and striker The striker is the part that helps press down the lid switch. Make sure it's not out of alignment. Overtime these parts can become loose and move from their original location. But is the most cases, lid switch just stopped working properly. So make sure you check lid switch with multimeter. It could be the control board (not common) Sometimes the control board will see an open lid switch and attempt to lock it. Other times when the board is faulty it is not able to detect if the lid is locked or not. Internal malfunctions can be caused by the machine reporting over or under voltage. It can also be due to a momentary loss of neutral feed to the control board. If this is the issue the door will remain locked for 3 minutes, even if you try to unplug the washer. If you are in a hurry you can unlock the door manually. There may be an issue with the actuator motor This problem can occur if the actuator motor (you can get it here) has gone bad or if it has loose wires. You'll need to access the part from underneath of the washer and first check the wiring going to it. If there are no loose or damaged wires, you will need to check the actuator motor to see if it's malfunctioning. Check the drain pump The lid can become locked if something is clogging the pump or filter drain. This means the washer is unable to drain properly, thus it won't unlock the door. It may also mean you need to replace a faulty drain pump. Troubleshooting A Whirlpool Front Loading Machine A front loading washer can be a bit different from a top loader in terms of door lock issues. Here are the things you'll need to check. Is there water going to the machine? This is a common problem if the water supply has been shut off after repairs or a move, and not turned back on before use. If this is the case you will need to reset the machine. Doing so is easy. You'll simply press WASH TEMP, then SPIN, then SOIL - one after another. Repeat this step 3 times. If that button combination doesn't work then the buttons you'll use are SPIN, SOIL, PRES/OAK. After pressing the correct button combination you will see the panel come to life, the error code will flash, and a humming sound may continue. You'll have to wait up to 10 minutes for the noise to end. Once it's gone, press the POWER button to clear the code. Check the drain pump and hose One of the common reasons both models will have issues with the door lock stems from the drain pump. You'll need to access the drain pump and check to see if there is a sock or other type of debris lodged in it. If so, simply removing the item should fix your problem. If it's not clogged, the drain pump may be malfunctioning. If this is the issue you will need to purchase a new one and swap them out. When water is visible inside the machine you can simply try to run a "SPIN and DRAIN" cycle to see if the water will be expelled. If you can get the machine to drain the door will unlock. The door switch may be malfunctioning The front load washer features a door switch that is actually a safety feature. On most Whirlpool models, the door must be closed and locked before any wash cycle will begin. These switches are generally located on the washer's door frame. Go ahead and inspect the door striker to ensure it's engaging properly with the lock assembly. You can also check for continuity in the door switch using a multi-meter. However, before doing this you will need to unplug the power and remove the machine's front panel. Check the sensor actuator/shifter. This is actually easiest to check if you look at your owner's manual and get into the manual diagnostics function. You'll need to try to get the machine to spin. If your machine's motor begins to hum for a second and then stops with the lid lock still blinking, you'll need to go back to the diagnostic codes to look for speed sensor or shifter errors. This will provide proof that this assembly is the problem because the motor speeds are not being read by the optical speed sensor. How To Manually Unlock The Door On A Front Loader Before trying to manually unlock the door you can unplug the washer for 1 to 2 minutes or simply flip the breaker off. This usually helps the control panel reset and allows the door to unlock and the light to stop flashing. However, if this doesn't work you can always manually open the door: Unplug the washer from the wall and pull it forward. Remove the screws on the back of the top panel. Pull straight back and up to take the top panel off. Once the top panel is removed you can reach behind the front panel on the right side of the door to locate the door lock assembly. There should be a small circular tab made from plastic at the bottom of the door lock. Pull down on this tab and the door should manually unlock. How To Manually Unlock The Door On A Top Loader Most of the time either unplugging this machine from the wall or simply holding the CANCEL button will cause the door to unlock. However, if this doesn't work and you need to manually unlock it, here's how: Unplug the washer from the wall. Turn off the water supply to the washer. Locate and access the cover to the drain pump. This should be near the bottom right of your washer on the front. Use a screwdriver to remove the one screw holding the compartment to the machine. You should see a plastic cord inside the compartment. Simply tug on this cord and it should unlock your door. In conclusion, there are a wide array of reasons a door will become locked on a Whirlpool washer. Did any of our fixes above work for you? Leave us a comment and tell us what you think. Try the other methods above for unlocking the door before trying this procedure. The door may unlock by itself after the failure condition no longer exists; however, if you want to take out your laundry immediately, first try to unlock the door as described in Error Code FdL or F29 in the Error Code symptom listed above or in your Owner's Manual. If the door still cannot be opened, perform the following: Before Opening Door: Turn off and unplug the washer/dryer. Close the water faucet. Wait until the drum has stopped rotating - never open the door while the drum is in motion. Wait until water and laundry have cooled down when washing with high temperatures. Always drain the water before opening the door by either: Touching and holding the Power button until "ES" appears on the display. Following the instructions in the "Cleaning and Maintenance" section above for "Cleaning the Drain Pump Filter". To Unlock and Open Washer Door: Remove the lower door panel by pushing the tabs located on both sides of the base panel to release it. With a Phillips head screwdriver, loosen and remove the Phillips head screw at the upper right portion of the access door compartment. 2. Pull down on the plastic strap marked "Door open" located beneath the removed screw. The door can now be opened and the laundry removed, if needed. 3. After removing clothes after starting a cycle. So, what you should do when your Whirlpool washer door is locked? Just follow the tricks below according to the needs of your washer.Image: Whirlpool Washing MachineHow to Unlock Whirlpool Washer Door Lock with CommandUnlocking your washing machine is easy with command. Just follow the steps below.Step 1Before going to unlock your washer, wait three to five minutes after completing a cycle. The motor control unit will receive a "Stop" command when the motor speed becomes 0 and passed 180 seconds. Your washer's door latch will only unlock when washer temperature is under 12 degrees Fahrenheit. If the temperate is set higher than Wool, Delicate or Hand Wash, it must drain before unlocking the door latch.Step 2After completing a cycle, long press the "Control Lock" button for three seconds. Door will be available to unlock when you listen unlatching sound.Step 3If your washing machine did not unlock at end of Step 1, don't worry. Hold down "End Cycle" button for five seconds that will work as a reset for your washer.Step 4Unplug your Whirlpool washer from the electric panel. Wait for 45 minutes. Plug your washer back to the electric outlet panel. Now washer's main control board is reset and door should open.How to Manually Unlock Whirlpool Washer Door LockIf your washer faces problems mechanically or electrically, it fails to unlock automatically. If the 1st trick doesn't work for you, don't stop. Here is another trick to help you.Step 1Unplug your washing machine from the electric outlet board. Wait for 3 to 5 minutes.Step 2Take a screwdriver. Remove your washer's bottom panel and pull it away.Step 3Reach the door lock through the open panel. Locate the door latch under the locking mechanism. Pull down it gently. At this position, you may hear a click sound and the door is ready to open. Final WordsYou no need to spend dollars for a technician when your washer faces an unlocking problem. Just apply above mentioned tricks when your Whirlpool washer door is locked. Apart from that if you need to unlock the door manually each time after completing a cycle, your drain pump or pressure switch is at fault. So, replace them to solve your washer's locking problem permanently. If you aren't experienced with repairing washing machine, send it to the manufacturer authorized service center.
