How to remove touchwiz from samsung phone. How to remove touchwiz samsung galaxy. How to remove touchwiz home has stopped. How to remove touchwiz from my phone. How to remove touchwiz home from galaxy s5. How to remove touchwiz home. How to remove touchwiz easy home. How to remove touchwiz from galaxy note 3.

Over the years, Samsung has taken a lot of heat from angry users due to their excessive suite of bloatware apps. On top of that, their custom launcher (TouchWiz home) lags behind in terms of stability and speed. Samsung flagships have enough processing power and system resources to achieve solid benchmarks despite being dragged down by a whole suite of unnecessary bloatware (for the most part) and a launcher that has clear limitations. However, if we go down Samsung's product line in the low-to-medium range, it becomes obvious that their performances are seriously affected by bloatware and launcher instability. TouchWiz is Samsung's proprietary front touch user interface. Although it might seem efficient with system resources due to its simplistic design, sadly that's not the case. In addition to demanding more resources than the stock Android launcher, it has some design flaws that frequently make it lag behind and become unresponsive. If you're a Samsung owner, there's a high chance you're familiar with TouchWiz's force stop errors. These errors are not restricted to one particular Samsung model and can be found on all devices running with this touch interface, although the frequency is smaller on flagships. For the most part, there are two variations of TouchWiz errors. "Unfortunately, TouchWiz Home has stopped" and "Unfortunately, TouchWiz has stopped". Regardless of which error message you're getting, the root causes for the two issues are roughly the same: TouchWiz glitches with old data and cache after an OS update. TouchWiz needs more system resources and becomes unresponsive. Conflicting 3rd party app. A glitched widget is causing TouchWiz to force stop. Inability to allocate enough resources for gestures and motions. Now that we know the causes, let's see how you can make the error go away. To make sure you cover all the troubleshooting aspects, please follow the methods below in order until you come upon a solution that works for you. Method 1: Clearing data and cache for TouchWiz Home. Most manufacturers make their devices to delete cached data from previous versions after updating the Android operating system, but not Samsung. A lot of users have reported that their TouchWiz interface has started displaying errors after upgrading the Android version to Lollipop, Marshmallow, or Nougat. Aside from the glitch provoked by the system update, TouchWiz can break down because of cache data accumulation. In addition to making your launcher unable to keep up with your actions, TouchWiz might become unresponsive and display the "Unfortunately, TouchWiz Home has stopped" error. Another clear indicator that you need to remove the cache from TouchWiz is if the error is displayed when you're trying to move apps inside TouchWiz's interface. Regardless of your device's symptoms, the following steps are always the first logical actions. Here's what you need to do: On your home screen, tap on your Apps drawer to expand it. Go to Settings > Applications and tap on Application Manager. Swipe from left to right in order to make your way to the All apps screen. Scroll down and tap on TouchWiz home. Tap on Clear Cache and then tap on Clear Data. If you can't find the two options, look inside the Storage folder. If you're using Easy Mode, repeat these steps with TouchWiz Easy home. Note: Keep in mind that this will remove your custom home screens, but you will still be able to find them in your gallery. Restart your device and see if the issue repeats. Method 2: Disable Motions & Gestures. Motions and gestures are known to glitch in some versions of the TouchWiz interface. Although this is less common on the latest models, older Samsung iterations that have modest specs will frequently encounter this issue. That's even more true with devices running an Android version older than Marshmallow. On your home screen, tap on the App drawer to expand it. Go to Settings and tap on Motions & Gestures. Systematically disable every motion and gesture present there. Restart your phone and see if the error message reappears. Method 3: Soft Reset your device. If you've cleared the cache and disabled motions & gestures without a result, let's assume the error appears as a result of a software glitch. A lot of times, a soft reset followed by draining the capacitors' stored electricity will refresh your phone's memory and the error will stop appearing. Depending on how your device is built, the steps are a little different. If you have a device with a detachable battery, here's what you need to do: Remove the back cover and take out the battery while the device is running. Keep holding the power button for over 30 seconds. This will drain the remaining electricity from various components capacitors, forcing a memory refresh. Put the battery back on and power up your phone again. In the event that you're working with a newer Samsung model that doesn't have a detachable back case (S7 or S7 Edge), here's what you should do: While your device is on, press and hold the Power button for about 10 seconds. This will trigger a soft reset. Note: A soft reset won't delete any of your personal data. Power your phone on again. Your Android will boot up and your apps will be re-optimized. Method 4: Changing the Animation scale. In some cases, making TouchWiz reconfigure its animation scale might eliminate the error message. One of the things you can do is change the animation scale. Here's how: Go to Settings and look for Developer option. If you can't find an entry called Developer option, scroll all the way down and tap on About device. Tap on Software info. Tap on Build number for 7 times, until you get a message saying "You are a developer". Go back to Settings and tap on Developer option. Scroll down all the way down to the Drawing category. Slightly alter the values of Window Animation scale, Transition animation scale and Animator duration scale. In order to avoid changing your device's movements through screens too much, I recommend increasing them by 0.5x. Restart your device and see if the error disappeared. Method 5: Switching to Easy mode. Easy Mode is designed to streamline the user experience even further by removing some complicated features that might clutter the screen and add to the confusion. Some users have reported that switching to Easy Mode and switching back to standard mode will remove the "Unfortunately, TouchWiz Home has stopped". Here's how: Go to Settings, scroll down to the Personal tab and tap on Easy mode. Switch the mode from Standard to Easy Mode. Browse through the menus for a good while and restart your device. After the restart, go back to Settings > Easy mode and set it to Standard mode. Method 6: Eliminating software conflicts. If the methods above didn't make the error go away, it could be that the TouchWiz interface is conflicting with a 3rd party app you recently installed. The chances of this happening are even higher if you have an inactive 3rd party launcher or a clipboard app like Enhanced Clipboard. A clear way to establish if TouchWiz Home is conflicting with 3rd party apps is to boot your device in Safe mode. While in Safe Mode, your device will be stopped from loading 3rd party apps and processes, so if the error doesn't repeat it's clear that a 3rd party software conflict is to blame. Here's what you need to do: Press and hold the power button. Tap and hold on Power Off. When the Reboot to Safe Mode prompt appears, tap OK. Your device will restart in Safe Mode. A Safe Mode icon should be displayed in the bottom-left corner. Browse around using the TouchWiz interface and see if the error is gone. If the error reappears move over to Method 7. However, if the error is gone, it's time to figure out which app or widget is causing the issue. Here's how: Go to Settings > Application manager and swipe to the Downloaded tab. Start by uninstalling custom launchers and widgets you might have on your system. Uninstall clipboard apps and icon packs. Think of the time the error first started appearing and remove the apps you might have installed during that period. Reboot your device. It should boot up in normal mode. Confirm this by checking if the Safe Mode icon is gone from the bottom left corner. Method 7: Wiping the cache partition. If you've come this far without results, it's time to apply a universal fix that solves most software related glitches. In the event that TouchWiz's message originates from Samsung's firmware, wiping the cache partition might make it go away. The procedure might slightly differ from device to device, but for the most part, the steps of wiping the cache partition are the same on most Samsung devices. If the steps described below won't take you into Android's system recovery, do an online search on "how to wipe cache partition + *YourModel*" Power off your device completely. Press and hold Volume Up key + Power button. Release both buttons when you see the Android screen. The next screen should take you to Recovery Mode. Use the volume buttons to navigate down to Wipe Cache Partition. With Wipe Cache Partition highlighted, tap the power button to select it. Wait for the process to complete. You'll know it's ready when you're device asks to reboot. Press the Power button to reboot and wait for your device to restart. Method 8: Doing a Master Reset. Now that we've burned through almost all of the available fixes, there's one last thing you can do before sending your phone for a re-flash. A factory reset will restore your phone to its factory state. In most cases, this will make TouchWiz resume its normal functionality. Before you go through it, it's important to realize that a factory reset will delete any of your personal data and account information that isn't on your SD card. For the sake of avoiding unnecessary data loss, the steps below will include creating a backup. Here's what you need to do: Go to Settings and scroll down to Backup & Reset. If Back up my data is disabled, enable it and wait for a new backup to be created. Scroll down and tap on Factory Data reset. Confirm by tapping on Reset Phone. Wait for the process to complete. Your device will reboot at the end of it.
