Thanks for the information. On the gold coloured front are the 3.5 mm line in and headphone out jacks, along with the large volume knob. Nobsound / Douk Audio NS-08E on Amazon Specifications Output power: ≥1100 mW (32 ohms) Headphone Adapter Impedance: 18-600 ohm Total harmonic distortion: MusicBee > Arcam irDAC-II (via usb) > NS-08E > headphones Headphones tested were Beyerdynamics Amiron Home + T5P 2nd gen and Yenona Studio Pro along with several IEMs. This little guy adds some warmth and fullness to the midrange while retaining detail and separation from the source. Tom I'm old enough to remember tube car radios. With plenty of power before getting to severe distortion, the NS-02E delivers a good subjective experience into high impedance headphones. All the electrolytic capacitors are 16 V types (possibly except one where I can't read the markings). Maybe it still works if one removes the tube... I'm an EE and know how tubes work but I'm far from being an expert. With harder to drive headphones like the T1 Pro the NS-08E can add some extra punch to the bass and a more controlled sense at the low end. No, it's not. The knob moves in tactile steps, similar again to the NS-01E and the same as the one on the FX-Audio DAC-X6. These tubes are totally incompatible if bought in error! But don't worry, you can purchase the 6J3 version here How do I check? People have a tendency to overestimate their hearing capabilities. About Nobsound (from their website): "Shenzhen Cavins Technology Co., LTD has been established since 2014. Low output impedance and high current delivery are not necessarily related. Any pix of the innards? "If I have been able to see further, it is because I have been surrounded by midgets" - Murray Gell-Man Best coffee on the planet Hmmmz 36 minutes that this review has been up and Google has it as the fifth search result when searching for, "Nobsound NS-02E." Some 2 hours that this "non headless tubeamp review" has been up and Walmart is out of stock Amir "the stock influencer" Page 2 Looks like it is running on +/- 12V and so the tube will be on 24V (plate at 12V) with 2 NE5532 in parallel on the output. A tube headphone amp with switching power supplies and solid state op-amps. A tube headphone amp with switching power supplies and solid state op-amps. The near definitive guide is from Merlin Blencowe. Fitting the wrong tubes can be dangerous, can damage your amplifier and can invalidate your 30-Day Warranty Weight 0.26 kg Units Single, Matched Pair We offer a No-Quibble 30 -Day Return & Refund on all our Products. edit: Just watched the video, skipping to the circuit. I'm not 100% certain, but I didn't pay very much for the headphone amp off eBay, so I would be very surprised if it was shipped with a non-OEM tube. Not for this price and size. Nobsound NS-02E Measurements As usual we start with our dashboard of feeding the unit 2 volts and adjusting the volume control to get 2 volts out. One channel has much more distortion than the other, bringing the average down even more than one wants to see. Noise floor is actually better than distortion. Frequency response rolls off in the bass indicating capacitor coupling. Tube stages tend to do well with high impedance loads as far as power and this is no exception: My threshold is 100 milliwatts for this test and the NS-02E sails past that if you allow plenty of distortion before clipping. So the engineering here isn't broken at all - they were going for a certain kind of sound and a certain price point, along with a certain "tube" identity which is attractive to some buyers. We aim to ship next Working Day by your chosen Postal Service. And surprise! The Loxjie P20 has better sound with the Grado as well. Regardless of that, this is a neat product that's cheap enough to be a viable option for most people to obtain. As a result of being Manufactured to a high specification in the Former USSR, these valves are highly robust. No lengthy returns or customs duties! \*Always check for the correct vacuum tube in your Manufacturer's User Manual. There have been a few mentions on the internet about the tube ringing sound that sometimes occurs if you bump the amp or the desk. Definitely fun and interesting to play with these cheap tube amps. Please be warned!! Because our Premium Nobsound NS 08E 6J9 Tube Equivalents Vacuum Tubes are long life USSR military 6J9P valves, they are a superb NOS Soviet direct Upgrade. If you have an itch for "tube sound" and have a high impedance headphone, the Nobsound NS-02E is low cost way to experience that. Use your ears to listen to music not as an analyzer. Well, this little hybrid tube amplifier can do all that. Lower impedance headphones could work if their sensitivity is high, but we did get these little distortion boxes. dflushjds Ahh tubes. 1980s. Pushing out 1100mW at 32 ohms the NS-08E had no problems driving the 600 Ohm T1 Pro with plenty of room left on the volume knob. It's the 21st Century! We didn't get jet packs, and we can precisely target big rockets to blow up at just the right spot... They used mechanical vibrators to create a rough AC that could be stepped up by a transformer to the 300V or so needed by the tubes, from the car's 6-12V battery. The night is coming, and it's filled with dark surprise. I assume there is a step up power supply in it. The Nobsound NS-08E is one of the more popular tube amps on the market because of its small size, ease of use and ample power making it a good starting point for people who want to venture into tube sound. With my Yenona Studio Pro, however, the ringing was easy to elicit so I'm guessing it's related to the impedance of your headphones. In a way it's kind of impressive that they can sell this for \$60. This. \*IMPORTANT - THERE ARE TWO VERSIONS OF THIS MODEL. In this case the low output impedance stems from lots of local negative feedback in the output stage. On the top of the black metal case are the two 6J9 tubes that simply plug into the provided sockets. We are striving to build classical extraordinary audio equipment with cultural connotation and propel national audio brands worldwide and pace up with the rest of the world." Disclaimer: This product was sent to me for the purpose of an honest review. Vintage tubes may cause serious damage when untested. Otherwise it is a strong pass. Its only 32 ohm. OK, took the top off: This thing is cuter inside than out! As we see there are two independent setup switching power supplies. The resistors are 0805 or 0603 types (so 0.125 W or 0.0625 W types). I am assuming the opamps are the front-end and the tube is the output stage. Conclusion The Nobsound NS-08E sounds better than it should given its budget price. Similar to the NS-01E, this amp is nicely machined and put together. Around the back are the DC 6V power input and the power button. Recommended. Conclusions Objectively the results are horrible other than available power into high impedance load. If you're curious about tube sound this is a great place to start and won't put too much of a dent in your wallet. They fit tightly into the sockets but are easy to install and remove with some care and gentle wiggling. I have some tubes that would work in it. If you are unsure about your Amplifier's requirements you can download a .pdf User Manual for free here \*Never buy these tubes from an untrusted source. Appreciate any donations using: Seems even @amirm can handle quite a load of distortion... It's a pity the 3.5 mm input isn't on the back so the space on the front panel could be left clean or perhaps have an additional 6.35 mm headphone jack in its place. I'd pretend I was one of those deaf-mutes I will be integrating this phrase into my lexicon. Hmmmz 36 minutes that this review has been up and Google has it as the fifth search result when searching for, "Nobsound NS-02E." The key phrase here is starved anode. Thanks for the review amir! I'm the original owner of this headphone amp (or the owner before sending it in for review - actually bought it used!), and I want to say the tube that's in there is the one that the headphone amp normally ships with brand new; it's not a nice GE tube or anything like that. It's learning for me. You can comfortably touch the case without any discomfort but I wouldn't recommend touching the actual tubes. That makes no sense... It's fast and detailed, capable of rumbling bass and extended treble and adds a rich meatiness to the mids for a very satisfying effect. My only recommendation for someone considering this would be to get something with a strong recommendation from the 1004B+ or even 1150B+ SINAD range and then get something like this later on, just to play around with. All opinions and observations here are my own, based on my experience with the product. What they are doing is using the tube to color the sound in a certain, fairly predictable way in order to satisfy certain listener's tastes. First off, I find the brand name hilarious. The price is excellent too, for anyone that wants to have a little fun. Could be. Life expectancy: 2000 hrs. There is not much else to the unit than 3.5 mm input and output jacks and a switching power supply: OK, there is a stupid blue LED that lights up the tube but that is common these days. I think Amir tested a passive, multi-XLR ins-outs (ports) preamp from this company and it measured very well. For a lower cost and specific purpose, this company seems to be doing well. Tested in the UK. With 300 ohm Sennheiser HD650 though, the NS-02E woke up and delivered early rattling levels with seemingly low audible distortion. The output impedance suggests there's a solid state buffer on the output. Free 2 x BS310 Set of silicone anti-vibration dampers. They're not going away. With sensitive IEMs you can sometimes detect a little background noise but it's not noticeable while music is playing and doesn't detract from the experience. It's so simple and small, obviously not as small as the NS-01E but still, it takes up very little space on the desktop. Agreed the distortion is typical tube, but could it be that the tube is just for display (hence the blue LED)? Treble and bass remain well extended on both ends. Please refer to our Return & Refund Policy for full details. Yet an amp is not able to deliver lots of current. If you have a 6J3 version it will have tall slender Tubes that have 7 Pins, if you have a 6J9 Version it will have squarish squat tubes that have 9 Pins, as seen in the photos. If the wrong tubes are ordered because you failed to check prior to purchase, we unfortunately will not be able to accept any returns or issue a refund. I got my doubt after I post that. Yeah. It sounds better than the Atom using a 300 ohm HD6XX headphone. This is a noob comment, but I loved the symmetry of the components within the amp. I built a couple of these and I quite liked them. I wonder if anyone has pointed out this potential for puerile snickering to the (probably) very serious Chinese engineers and businesspeople behind the Nobsound line of audio goods... 6J1, 6B11D, 6AK5, 6BC5, 403A/B, 5654, EF40, EF95, CV850, 6J2, 6D12D, 6AS6, CV2522, EF11/732, CV4011, 6J3, 6D13D, EF96, CV848, 6BC6, 6AG5, 6J4, 6D14, 6I36, 6BX6, 6AC7, EF94, 6AU6, 6J5, 6D15D, EF90, CV2521, 6F36, 6AH6, 6AN5, 6K4, 6K5, 6K4D, 6BA6, 6DA6, EF89/93, 5749 This is a review and detailed measurements of Douk Audio Nobsound NS-02E vacuum tube headphone amplifier. A Complete 6J9 Tube Equivalents 6J9P Matched Pair Upgrade for the Nobsound NS-08E Mini Valve Amplifier. Edit: amir beat me to it by seconds! OK, took the top off: View attachment 110263 This thing is cuter inside than out! As we see there are two independent setup switching power supplies. 250 Ohm and above should be fine. You know listening to low bit-rate MP3's through this thing might actually offer a more musical sound than a nice clean amplifier, this kind of euphonic "sweetening" can gloss over certain shortcomings in source material. I find these little devices are a lot of fun to play around with, look at, and see how they sound. I mean, there is a place for vacuum tube distortion - but it's at the other end of the chain! Thanks for the review Amir. Maybe you just want some cool glowing lights on your desk or you simply need to make your music louder. Does anyone know what's the lowest supply voltage a tube can work with? :- ) It has only 0.8 ohm output impedance, it is fine for low-impedance headphones. It's a pity that it doesn't measure well for low impedance HPS. The symmetrical layout and topography gets better too. Yes, and thanks for sharing that document (which is new to me).
