If your iPhone is a data connection and you are wondering if you can share this link with Android using the iPhone hot spot, you are in the right place. The Android device can easily connect to the iPhone hot spot. The mobile hot spot allows you to share your iPhone Internet connection not only with iOS devices, but also with all other mobile devices. When this feature is enabled, the iPhone acts as a router and a modern task. Connection to the iPhone hot spot from Android can easily connect your Android phone to the iPhone hot spot if the iPhone is activated by your personal hot spot. The iPhone hot spot is a data connection to a low router to a low router to connect the nearby devices to the hot spot as it will connect to the WiFi network to access the Internet. The iPhone hot spot network is an ordinary Wi-Fi connection to Android, which connects it as much as other Wi-Fi hot spots. The first step is to share your iPhone Internet connection with Android access. Open the iPhone settings and make sure the mobile data are effective. Otherwise, touch your mobile data and select your favorite network. You should also share the iPhone data link. Go to the "personal hot spot" and activate "Let others unite". Set your personal hot spot password to prevent unauthorized access to your hot spot. If you want to change the default name assigned to the network to the network, go to settings> General> Bentle and enter the new name "AD". At this point, the iPhone connection is shared. Switch to Android, go to settings> Add and select Wi-Fi. In the previous step, select the hotspot network you activated your iPhone, enter your Android password and press the Connect key, now you can access the Internet on your Android device using your iPhone. If you have problems with the iPhone hot spot, try these steps: Check that your iPhone is an effective data plan and your mobile data connection is restarted on your Android phone, starts iPhone, iPhone, iPhone, which can be found on the iPhone. Hotspot, try these steps, follow your phone to get an iPhone for Android, follow the iPhone network that connects problems with the iPhone. Get the latest iOS version to work on your iPhone. You want to check the availability of iOS update, go to Settings> Information on Insurance Software Update Open allows you to participate ". Hotpot personal setting as seen above on iPhone. Double-check iPhone password and reformat android in iPhone Settings > Personal Hotspot "Maximize Compatibility" (Note: This may slow down the internet speed a bit). Try resetting your network settings. Data will remain the same): Settings> General> Reset network settings also restore: I hate how to connect Android and iPhone using iPhone Bluetooth, it is possible to share the data connection from Android to iPhone. Bluetooth test. On Android, go to settings > connection and turn on Bluetooth, then click on mobile hotspot and tethering and turn on Bluetooth tethering. iPhones can also share a cellular data connection using Bluetooth. To set up network sharing via Bluetooth, go to Settings > Bluetooth on iPhone and open Settings. Leave the Bluetooth screen until you connect. Switch to Android Bluetooth settings and pair iPhone. Request to access the Internet from Android and you are ready to use the iPhone network using Bluetooth tethering. Connection, each option has its pros and cons. First, Bluetooth tethering only allows one connection, which is very limiting if you need to share the connection with two or more devices. Once upon. The only downside to the combination of these devices is that they compete for bandwidth, resulting in low data transfer rates for the devices. Bluetooth testing works well for sharing a device connection because it uses less battery than a hotspot. In the area However, it should be noted that tethering Bluetooth has a lower speed than hotspot. Calls can also break tethering via Bluetooth. Below is a test operation with the same iPhone when sharing data via Bluetooth hotspot and tethering. The Bluetooth hotspot, which creates another connection disadvantage when using Bluetooth testing, is that if an iPhone or Android device accepts a call, the connection may stop as it is. Attempting to connect to a nearby Bluetooth audio device and connect. By using an iPhone as an Android TV hotspot, the iPhone hotspot can also be used to share internet connection with Android TV. It's as easy as sharing with other Android devices. Follow the same steps to configure hotspot on iPhone as above using Browser parameters > Personal Hotspot and allow to reach and define a password. Then to connect Android TV to the iPhone access point, open the parameters of your Android TV by pressing the button with the gear icon on the TV. Then select Network & Internet on WiFi, which also lists all networks that carry your Android TV. If your network is not listed, "Scanning is always available" and try again. Select the name of your iPhone hotspot, enter the passcode you created earlier, then press Connect. You should now be able to use your iPhone's internet connection on Android TV. How to exclude an Android device from Personal Hotspot by excluding your Android device or any other device connected to your iPhone's Personal Hotspot. The best way to do this is to change the passcode for the previously defined iPhone access point set, which will force the connected devices to re-enter the passcode, thereby terminating the connection. To change your iPhone hotspot password, go to Settings > Personal Hotspot and enter a new password in the Password field. See also: Can an Android device connect to an iPhone hotspot? How to exclude an Android device from Bluetooth tethering If you want to share your iPhone's internet connection via Bluetooth tethering and disconnect the connected Android device, all you have to do is remove the device from your iPhone's Bluetooth settings. To unpair and unpair a paired device, open Settings > Bluetooth on iPhone, find the paired Android device, and tap the icon next to the dual device name. In the connected device's settings, select "Forget this device". This will prevent your network from being shared via Bluetooth tethering. attached.
