Nexus 4 ubuntu touch

Lg nexus 4 ubuntu touch. Ubuntu touch nexus 4 download

Last week I tried Ubuntu Touch on my Nexus 4, and it was easy to install EN to recover Android. So today I wanted to show the preview to some friends, and something went very badly. Current status: At start-up I get a black screen what I did: 1 updated my system (apt-apt-get update) 2 installed (sudo phablet-Flash - B) After my phone crashes on the Google logo during startup. The recovery method started and started poking. If a device will lead to Plasma OS will work on others. For more information: The OTA-2 was released and the Nexus 4 obtained its first stable version ubuntu-touch- ota-2-release-78 currently the tendency of ubports adoption: reactions: ze7zez, trickster22, nin.chobhe and 1 other person soooo there is a way to flash This from TWRP? I tried to flash both from a Ubuntu machine and upstairs machine Windows. And beyond. In the last 3 days, and I'm really annoyed. On Ubuntu, but always crashes after pushing only a couple of things, and as soon as you sit down. On the left at night. On Windows, detects ADB and the device more than good, but no matter how many times I restarted to the bootloader, even with the Nexus 4 correct installed drivers, nothing. As soon as you sit down. I can install Android or sail fish is not a problem. ------------ Message added to 10:21 -------- Previous post was at 10:15 ------ Did a fresh ride right now, It still doesn't work [email, protected]: ~ \$ sudo ubuntu-device-flash --Server = http://system-image.ubports.co m Tocco --Device = Mako --Channel = 15.04 / Devel -/home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C31084EFA199138E93BFED8FC58AA3EB06BDF75A78AF9B57.Tar.xz to the device 2017/09/28 10:20:18 Start to push / home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C31084EFA199138E93BFED8FC58AA3EB06BDF75A78AF9B57.Tar.xz to the device 2017/09/28 10:20:18 Start to push / home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C31084EFA199138E93BFED8FC58AA3EB06BDF75A78AF9B57.Tar.xz to the device 2017/09/28 10:20:18 Start to push / home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C31084EFA199138E93BFED8FC58AA3EB06BDF75A78AF9B57.Tar.xz to the device 2017/09/28 10:20:18 Start to push / home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C31084EFA199138E93BFED8FC58AA3EB06BDF75A78AF9B57.Tar.xz to the device 2017/09/28 10:20:18 Starting to push / home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C31084EFA199138E93BFED8FC58AA3EB06BDF75A78AF9B57.Tar.xz to the device 2017/09/28 10:20:18 Starting to push / home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C31084EFA199138E93BFED8FC58AA3EB06BDF75A78AF9B57.Tar.xz to the device 2017/09/28 10:20:18 Starting to push / home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C31084EFA199138E93BFED8FC58AA3EB06BDF75A78AF9B57.Tar.xz to the device 2017/09/28 10:20:18 Starting to push / home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C3108EFA199138E93BFED8FC58AA3EB06BDF75A78AF9B57.Tar.xz to the device 2017/09/28 10:20:18 Starting to push / home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C3108EFA199138E93BFED8FC58AA3EB06BDF75A78AF9B57.Tar.xz to the device 2017/09/28 10:20:18 Starting to push / home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C3108EFA199138E93BFED8FC58AA3EB06BDF75A78AF9B57.Tar.xz to the device 2017/09/28 10:20:18 Starting to push / home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C3108E9AF9B57.Tar.xz to the device 2017/09/28 10:20:18 Starting to push / home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C3108E9AF9B57.Tar.xz to push / ho /ian/.cache/ubuntuimages/gpg/image-signing.tar.xz to the device 2017/09/28 10:20:18 Start Pushin g /home/ian/.cache/ubuntuimages/gpg/image-master. tar.xz to the device 2017/09/28 10:20:18 Start Pushin g /home/ian/.cache/ubuntuimages/gpg/image-master. device 2017/09/28 10:20:18 made /home/ian/.cache/ubuntuimages/ubports-touch/15.04/ push / make push /home/ian/.cache/ubuntuimages/pool/Keyring-4C4E7EF380EBCFA2C31084EFA199138E93BFED8FC58AA3EB06BDF75A78AF9B57.Tar.xz to device 2017/09/28 10:20:18 Done /home/ian/.cache/ubuntuimages push / gpgg/image-master.tar.xz to the device 2017/09/28 10:20:19 error pushing: I also tried that magic flash tool many times. Just tried again, and it's, yes, just sitting there. Last modified: 28 September 2017 Your fastboot is unlocked? When does the flash is the phone in FastBoot mode? Have you tried a manual push for Android or Pestichish? Last modified: 29 Sep 2017 Nothing works for me. 1.) The Windows-Tool will not find the Nexus 4 but it is in FastBoot and Unlocked mode 2.) My Sets of Ubuntu, 16.04. and 17.04 Do not install Ubuntu-device-tools and the Magic tool has the same problem, you will not find a device, even when it is in FastBoot mode (it has the same problem, you will not install my Ubuntu-device device tools) Guess, 1) Widenows do not have the correct Nexus 4 driver. 2) I'm not sure to understand. You can not install, Ubuntu-device-tools on your computer, correct? Source: nothing works for me. 1.) The Windows-Tool will not find the Nexus 4, but it is in FastBoot and Unlocked mode 2.) My Sets of Ubuntu, 16.04. and 17.04 Do not install Ubuntu-device-tools and the Magic tool has the same problem, you will not find a device, even when it is in FastBoot mode (it has the same problem, you will not install the Ubuntu-device tools) thanks for the registry, Do you have enough space available on your Nexus 4? You tried with the UBPorts installer: There is information on how to install it when you scroll down. Soooo there is a way to flash this from twrp? I tried to flash both from a Ubuntu machine and a Windows machine. And beyond. In the last 3 days, and I'm really annoying. On Ubuntu, it always remains blocked after pushing only some things, and simply sits there. Leave overnight. On Windows, Detect ADB and the device is just fine, but no matter how many times restarts to the bootloader, It never gets more than this on the magical instrument. Last modified: October 9, 2017 Vela fingers the operating system is Linux Distro. Ubuntu Touch is not real Linux! Missing many apps is much more slow, so the Pepetherland operating system, and you can't run Android apps like the fisherman of the silfo. AlienTalvik is also available for brought devices. I have my Nexus 4 and 5. Everything works on Nexus 5 with cm12.1 base has minor problems. The camera does not work and the sound does operating system, just to collect a lot of people around the same interest. The OS fish sail and UbunTutuach have two different approaches to the mobile operating system. For sure the aircraft fish operating system. For sure the aircraft fish operating system is more polished than Ubuntu Touch, however it is not completely openource. It also does not provide convergence capacity and a GPS navigation system as a UNAV, . As for the Android app, there is really no hurry to go there. The main objective at this time is to bring the device with the right kernel to Ubuntu 16.04 LTS to access further updates of functionality and security. The team has already released a beta version of 16.04 lts for 2-3 phones (Fairphone, N5 and HTC10) This operating system update will bring the possibility to use Anbox on Ubuntu Touch: if you want to follow the New App Store and look at I invite you to watch the OpenStore app included in the Ubuntu-Device-Flash" and "Phablet Tools" on Ubuntu Versions made and the same for the Magic-Installer tool. There is no way to install it on my Nexus 4. It is normal that it is not possible to install Ubuntu-Touch on your Ubuntu / laptop sudo desktop APT-Get Install Ubuntu-device-flash Phablet Tools 2. Restart the Nexus 4 in FastBoot mode and connect the device with a USB cable to the computer. 3. Flash device using this command: (note this drying your phone !!) sudo ubuntu-device-flash --Server = http://system-image.ubports.com Tap --Device = Mako-channel = 15.04 / Devel --Bootstrap as mentioned on this page: Last modified: 1-Nov-2017 Reactions: ZE7ZEZ Thank you. Many cool thread. Currently on my Nexus 4 with the ROM is installed Ubuntu Xenial. I used Linux. In Android and Linux. In Android via DualBoot / MultiBoot or anything else? Reactions: AIECXS Page 2 Are you the job for Mako Continue? Thanks slash.tux, but meant specific advancement for mako, if he still persists .. Maybe I should monitor some commits on github, I don't know .. thanks slash.tux, but meant specific advancement for mako, if he still persists .. Maybe I should monitor some commits on github, I don't know The limitation are currently coming from the operating system not telephone support, especially on Mako everything works. As soon as one of the main update lands on the Ubuntu Touch Mako is to get it. The next specific improvement for Mako will change the Anbox reception kernel, it could happen if someone follows the work done on the main devices. What if not like the specific progress for Mako? If none of follow, would you do it? That's why I asked if you're maintainer, I could be, but there are more competent people on the line before me. Anbox, yes, and even Snap support. I'm not sure if possible. In reality, I am wonder what keeps in Mako 'Legacy' state, and if we could change it. Because the developers are not many and cannot officially support so much, you are taking care of more invisible things for us, such as servers, website creation, of the Halium project, 16.04 migration, construction of a push server etc. ... another limitation for the Mako to return to the top, is his Qty Aries. Ubuntu Touch tends to go to convergence and ram is better to run a desktop phone application. In any case, despite being inheritance ... still get updates: Thank you. But I thought the limitation to Mako is that of the kernel is too old PS: they are not really interested in managing "desktop applications" on phone truly. So I hoped, at least for usually smartphone needs Ubuntu Tocco would no longer be hungry than Android last modification: Jan 5-2018 thanks. But I thought the limitation to Mako is that of the kernel is too old PS; they are not really interested in managing "desktop applications" on phone truly. truly. So I hoped, at least for usual smartphone needs Ubuntu Touch would no longer be hunger for Android it is corrected, but this is valid for the whole phone ... The Nexus 5 as the main device is not new. He needs all the kernel backport that the reason they can't focus throughout the phone, but request of pull are more than welcome. With 16.04 LTS + MIR 0.029 Now you can run some KDE applications, still in Developpement but within a few months we should over it. Last community update today: reactions: yes bam80 But this is valid for the whole phone ... the Nexus 5 as the main device is not new. He needs all the kernel backport that the reason they can't focus throughout the phone, but request of pull are more than welcome, HM, I thought that no kernel backports, but the kernel backports but the kernel backports one for one, which takes time? In this case, whatever the possibility that these features will also be reported for Mako? Has anyone tried the installer on Mac OS? The Installer on Mac OS? The Installer app starts and detects the Nexus 4. When I continue to restart the phone is running at Nitrogenes, the phone is unlocked (bootloader). HM, I thought you don't do backports at the kernels must be just fresh enough to support Systemd, Snaps, Anbox. Or do you also mean the Nuxus 5 kernel too old to support all these features will also be reported for Mako? In any case, the kernels are freezing to a specific version due to the blob, so any kernel will need a patch to support these new features. Each feature from backport to each kernel, then takes time. My feeling is if the N5 is retrograted with the characteristic, it should be feasible to do it on the N4, but I can't guarantee that someone has tried the installation from the UBPORTS installer on Mac OS? The Installer app starts and detects the Nexus 4. When I continue to restart the phone is running at Nitrogen, the phone is unlocked (bootloader). From what I read, I would bet that your Mac does not have the correct ADB driver. However I'm not using this operating system, so I can't help. If you want more support for joint UBPORTS telegram group; you will be redirected to a special group to assist you during installation. A teaser anbox on ut: Reactions: BAM80 BAM80
